

Flunixin Injection

(flunixin meglumine)

R

NON-STEROIDAL ANTI-INFLAMMATORY AGENT FOR USE IN BEEF, DAIRY CATTLE AND HORSES

Potent, Fast-Acting Anti-Inflammatory

- Flunixin Meglumine is a potent, non-narcotic, non-steroidal, analgesic drug with anti-inflammatory and anti-pyretic activity
- In cattle, Flunixin Injection is indicated for the control of pyrexia associated with bovine respiratory disease and endotoxemia and acute bovine mastitis
- In horses, Flunixin Injection is recommended for the alleviation of inflammation and pain of musculoskeletal disorders and for the alleviation of visceral pain associated with colic
- Read the entire insert for full disclosure and warnings prior to use. Prescription required

Dosage And Administration

Flunixin Injection is administered intravenously in beef and dairy cattle, and administered intravenously (IV) or intramuscularly (IM) in horses

How supplied: 100 mL and 250 mL multi-dose vials

Each mL contains 50 mg flunixin meglumine

Withdrawal period prior to slaughter: 4 days for cattle

Milk taken from animals during treatment and for 36 hours after the last treatment must not be used for food

Ask your Distributor today about potent, fast-acting Flunixin Injection.

Observe label directions and withdrawal times. Not for use in bulls intended for breeding, dry cows or in calves to be processed for veal. Cyclooxygenase inhibitory NSAIDs may be associated with gastrointestinal, renal and hepatic toxicity. Concomitant use with other anti-inflammatory drugs should be avoided or closely monitored. Rare instances of anaphylactic-like reactions, some of which have been fatal, have been reported. See product labeling for full product information.

FLUNIXIN INJECTION (Flunixin Meglumine)

Injectable Solution 50 mg/mL
ANADA 200-308, approved by FDA

Veterinary

For Intravenous or Intramuscular Use in Horses and for Intravenous Use in Beef and Dairy Cattle.
Not for Use in Dry Dairy Cows and Veal Calves.

Caution

Federal law restricts this drug to use by or on the order of a licensed veterinarian.

Description

Each milliliter of Flunixin Injection contains flunixin meglumine equivalent to 50 mg flunixin, 0.1 mg edelate disodium, 2.5 mg sodium formaldehyde sulfoxylate, 4.0 mg diethanolamine, 207.2 mg propylene glycol, 5.0 mg phenol as preservative, hydrochloric acid, water for injection q.s.

Pharmacology

Flunixin meglumine is a potent, non-narcotic, non-steroidal, analgesic agent with anti-inflammatory and anti-pyretic activity. It is significantly more potent than pentazocine, meperidine, and codeine as an analgesic in the rat yeast paw test.

Horse: Flunixin is four times as potent on a mg per mg basis as phenylbutazone as measured by the reduction in lameness and swelling in the horse. Plasma half-life in horse serum is 1.6 hours following a single dose of 1.1 mg/kg. Measurable amounts are detectable in horse plasma at 8 hours post injection.

Cattle: Flunixin meglumine is a weak acid (pKa=5.82)¹ which exhibits a high degree of plasma protein binding (approximately 99%)². However, free (unbound) drug appears to readily partition into body tissues (VSS predictions range from 297 to 782 mL/kg)²⁻⁵. Total body water is approximately equal to 570 mL/kg⁶. In cattle, elimination occurs primarily through biliary excretion⁷. This may, at least in part, explain the presence of multiple peaks in the blood concentration/time profile following IV administration⁸.

In healthy cattle, total body clearance has been reported to range from 90 to 151 mL/kg/hr²⁻⁵. These studies also report a large discrepancy between the volume of distribution at steady state (VSS) and the volume of distribution associated with the terminal elimination phase (V_{dβ}). This discrepancy appears to be attributable to extended drug elimination from a deep compartment.⁹ The terminal half-life has been shown to vary from 3.14 to 8.12 hours.²⁻⁵

Flunixin persists in inflammatory tissues⁸ and is associated with anti-inflammatory properties which extend well beyond the period associated with detectable plasma drug concentration.^{4,9} These observations account for the counterproductive hypothesis associated with flunixin's pharmacokinetic/pharmacodynamic relationships.¹⁰ Therefore, prediction of drug concentrations based upon the estimated plasma terminal elimination half-life will likely underestimate both the duration of drug action and the concentration of drug remaining at the site of activity.

Indications

Horse: Flunixin Injection is recommended for the alleviation of inflammation and pain associated with musculoskeletal disorders in the horse. It is also recommended for the alleviation of visceral pain associated with colic in the horse. Cattle: Flunixin Injection is indicated for the control of pyrexia associated with bovine respiratory disease, endotoxemia and acute bovine mastitis. Flunixin Injection is also indicated for the control of inflammation in endotoxemia.

Dose and Administration

Horse: The recommended dose for musculoskeletal disorders is 0.5 mg per pound (1 mL/100 lbs) of bodyweight once daily. Treatment may be given by intravenous or intramuscular injection and repeated for up to five days. Studies show onset of activity is within 2 hours. Peak response occurs between 12 and 16 hours and duration of activity is 24-36 hours.

The recommended dose for the alleviation of pain associated with equine colic is 0.5 mg per pound of bodyweight. Intravenous administration is recommended for prompt relief. Clinical studies show pain is alleviated in less than 15 minutes in many cases. Treatment may be repeated when signs of colic recur. During clinical studies approximately 10% of the horses required one or two additional treatments. The cause of the colic should be determined and treated with concomitant therapy.

Cattle: The recommended dose for control of pyrexia associated with bovine respiratory disease and endotoxemia and control of inflammation in endotoxemia is 1.1 to 2.2 mg/kg (0.5 to 1 mg/lb, 1 to 2 mL per 100 lbs) of bodyweight given by slow intravenous administration either once a day as a single dose or divided into two doses administered at 12 hour intervals for up to 3 days. The total daily dose should not exceed 2.2 mg/kg (1.0 mg/lb) of bodyweight. Avoid rapid intravenous administration of the drug.

The recommended dose for acute bovine mastitis is 2.2 mg/kg (1.0 mg/lb; 2 mL per 100 lbs) of bodyweight given once by intravenous administration.

Contra-indications

Horse: There are no known contra-indications to this drug when used as directed. Intra-arterial injection should be avoided. Horses inadvertently injected intra-arterially can show adverse reactions. Signs can be ataxia, incoordination, hyperventilation, hysteria and muscle weakness. Signs are transient and disappear without antidotal medication within

a few minutes. Do not use in horses showing hypersensitivity to flunixin meglumine.

Cattle: There are no known contra-indications to this drug in cattle when used as directed. Do not use in animals showing hypersensitivity to flunixin meglumine. Use judiciously when renal impairment or gastric ulceration are suspected.

RESIDUE WARNINGS:

Cattle must not be slaughtered for human consumption within 4 days of the last treatment. Milk that has been taken during treatment and for 36 hours after the last treatment must not be used for food. Not for use in dry dairy cows. A withdrawal period has not been established for this product in perinatal calves. Do not use in calves to be processed for veal. Not for use in horses intended for food.

Precautions

As a class, cyclo-oxygenase inhibitory NSAIDs may be associated with gastrointestinal and renal toxicity. Sensitivity to drug-associated adverse effects varies with the individual patient. Patients at greatest risk for renal toxicity are those that are dehydrated, on concomitant diuretic therapy, or those with renal, cardiovascular, and/or hepatic dysfunction. Since many NSAIDs possess the potential to induce gastrointestinal ulceration, concomitant use of Flunixin Injection with other anti-inflammatory drugs, such as other NSAIDs and corticosteroids, should be avoided or closely monitored. Horse: The effects of Flunixin Injection on pregnancy has not been determined. Studies to determine activity of Flunixin Injection when administered concomitantly with other drugs have not been conducted. Drug compatibility should be monitored closely in patients requiring adjunctive therapy.

Cattle: Do not use in bulls intended for breeding, as reproductive effects of Flunixin Injection in these classes of cattle have not been investigated. NSAIDs are known to have potential effects on both parturition and the estrous cycle. There may be a delay in the onset of estrus if flunixin is administered during the postpartum phase of the estrous cycle. The effects of flunixin on imminent parturition have not been evaluated in a controlled study. NSAIDs are known to have the potential to delay parturition through a toxic effect. Do not exceed the recommended dose.

Safety

Horse: A 3-fold intramuscular dose of 1.5 mg/lb of bodyweight daily for 10 consecutive days was safe. No changes were observed in hematology, serum chemistry, or urinalysis values. Intravenous dosages of 0.5 mg/lb daily for 15 days, 1.5 mg/lb daily for 10 days, and 2.5 mg/lb daily for 5 days produced no changes in blood or urine parameters. No injection site irritation was observed following intramuscular injection of the 0.5 mg/lb recommended dose. Some irritation was observed following a 3-fold dose administered intramuscularly. Cattle: No flunixin-related changes (adverse reactions) were noted in cattle administered at 1X (2.2 mg/kg, 1.0 mg/lb) dose for 9 days; 4X (8.8 mg/kg, 4.0 mg/lb) dose for 9 days; 5X (11.1 mg/kg, 5.0 mg/lb) dose for 9 days; with occasional findings of blood in the feces and/or urine. Discontinue use if hematuria or fecal blood are observed.

Adverse Reactions

In horses, isolated reports of focal reactions following intramuscular injection, particularly in the neck, have been reported. These include localized swelling, sweating, induration, and stiffness. In rare instances in horses, fatal or nonfatal obstructive ileitides or other reactions, have been reported in association with intramuscular use of Flunixin Injection. In horses and cattle, rare instances of anaphylactic-like reactions, some of which have been fatal, have been reported, primarily following intravenous use.

How Supplied

Flunixin Injection, 50 mg/mL, is available in 50 mL, 100 mL and 250 mL multi-dose vials.

Store between 2° and 30° C (36° and 86° F).
